Kubeflow local setup

Install vagrant – for windows

Install | Vagrant | HashiCorp Developer

Install Virtual box – for windows

Downloads – Oracle VM VirtualBox

Terminal commands

Open a terminal on your laptop, create a new directory, switch into it, and run the following 2 commands to install MiniKF:

"vagrant init Arrikto/minikf"

"vagrant up"

1) vagrant init arrikto/minikf

This command will create a vagrant file into your newly created directory.

Into that Vagrant file, find the *config.vm.box* command and instead of just: **config.vm.box = "arrikto/minikf"**

 add:

config.vm.box = "arrikto/minikf"

config.vm.box_version = "20210428.0.1"

config.vm.box_url = "https://vagrantcloud.com/arrikto/minikf"

Save the file and close it.

2) vagrant up

This command will get your local machine started; you will see you kubeflow central dashboard to get started. Rerun the vagrant up command when it is asked to do on the command prompt.

Note: It will take a lot of time if your internet speed is less than 10mbs/sec.
